Software Laboratory

Summer Semester 2025/26

Evaluation Sheet, LEIC43D, variant 1

The submission of the solution must be carried out by creating (and pushing) the branch `eval1-nnnnn`, where **nnnnn** represents the five digits of your student number.

To achieve this, you can execute the following sequence of commands:

- `git clone <repo-url>`
- `git checkout <phase2-tag>`
- `git checkout -b eval1V1-<number>`
- Make the changes
- Add new files (e.g. `git add ...`)
- `git commit -am "eval1V1"`
- `git push origin eval1V1-<number>`

Place the answers to the theoretical questions in separate markdown files, located in the root directory.

1. In the context of the Git version control system, what is the difference between the ***commit*** and ***push*** commands? Indicate the situations in which you used each of the commands during the execution of the project.
2. Indicate two situations in the project where an HTTP response with a status code of *400* is returned. Justify why this decision was made.
3. Add an operation to your project's Web API to retrieve the list of users who have at least one booking in a given year. The information must be retrieved from the Postgres database, and must return, at a minimum, the name and email of each user. Do not forget to also include the validation test(s) for the operation's implementation.

Duration: 90 minutes
